Description	The programmed cell death 1 protein (PD-1, PDCD1, CD279) is a member
	of the CD28 family of immunoreceptors that regulate T cell activation and
	immune responses. The PD-1 protein contains an extracellular Ig V $% \left({{{\rm{PD}}}_{\rm{T}}} \right)$
	domain, a transmembrane domain, and a cytoplasmic tail that includes an
	immunoreceptor tyrosine-based inhibitory motif (ITIM) and an
	immunoreceptor tyrosine-based switch motif (ITSM). PD-1 is activated by
	the cell surface ligands PD-L1 and PD-L2. Upon activation, PD-1 ITIM and
	ITSM phosphorylation leads to the recruitment of the protein tyrosine
	phosphatases SHP-1 and SHP-2, which suppress TCR signaling. In

addition to activated T-cells, PD-1 is expressed in activated B-cells and monocytes, although its function in these cell types has not been fully characterized. The PD-1 pathway plays an important role in immune tolerance; however, research studies show that cancer cells often adopt this pathway to escape immune surveillance. Consequently, blockade of
