Description	<p>GDF-15 is a cytokine protein belonging to the TGF-β superfamily. It is widely expressed in the human body, including in tissues such as the liver, heart, kidneys, lungs, intestines, muscles, brain, and pancreas. The expression of GDF-15 is regulated by various physiological and pathological conditions, such as inflammation, tumors, cardiovascular diseases, and metabolic disorders.</p> <p>GDF-15 plays an important role in physiological processes such as cell proliferation, apoptosis, inflammation, and metabolism. It is considered an important inflammatory marker, playing a crucial role in inflammatory responses and immune reactions. Additionally, GDF-15 has been found to be closely associated with the occurrence, development, and metastasis of tumors, affecting tumor growth by regulating cell proliferation, apoptosis, invasion, and metastasis pathways. In recent years, research has revealed that GDF-15 is also linked to many other diseases such as cardiovascular diseases, metabolic syndrome, diabetes, and kidney diseases. Therefore, GDF-15 has become a research hotspot and is widely used in aspects like disease diagnosis, prognosis assessment, and treatment monitoring.</p>
